LASER DRILLING SYSTEMS FOR TABLETS OR CAPSULES

Control Micro Systems is the industry innovator in pharmaceutical tablet laser drilling systems and laser marking. With over 20 years experience developing high speed, “on-the-fly” laser systems, we are your best choice for drilling your tablets or capsules. We have supplied both production and research and development systems to pharmaceutical companies around the world.

Control Micro Systems offers true “on-the-fly” tracking of tablets producing superior aperture quality over the full range of aperture sizes. The bowl feeder and handling system offer a superior handling environment for a smoother transition and reduced chance of tablet breakage and lost yield. This design allows for a large range of tablet dimensions to be drilled with little to no changeover between sizes. The CMS software package provides process validation and is provided with software for compliance to 21 CFR part 11. The CMS system provides for 100% vision Inspection of the tablets. In addition, CMS also provides the support and documentation for the IQ, OQ, and PQ tests.
